IT Incident Management Standard

Approved by CEO
24 June 2025

1 Introduction

This standard form the basis for the incident management process at Tradedoubler. It describes how IT incidents are handled within Tradedoubler and details the workflow for handling incidents. The standard enables Tradedoubler to discover and assess incidents, to activate an organization managing the incident, and by appropriate actions restore Tradedoubler's operations to an acceptable risk level, all in an efficient manner.

1.1 Definitions

In this standard, IT incidents are defined as any incident occurring in Tradedoubler's production environment that is negatively affecting Tradedoubler's operations, including IT incidents related to Tradedoubler´s cloud providers and Billing system. This includes security incidents.

There are three severity levels of incidents:

- Minor incident: System or service that emits warnings but does not cause a loss of service.
- Moderate incident: System or service that emits warnings or errors and may cause disruption to services for some users.
- Major incident: System or service that emits errors and causes disruption to all or a significant number of users.

Incidents related to Oracle Cloud are not in scope for this standard. Incidents related to Oracle Cloud are handled by the third-party vendor Cegal according to their playbook.

For incidents related to Metapic contact Erik Axelsson.
Email address: erik@metapic.com

1.2 Objectives

This standard provides guidelines on how to manage IT incidents within Tradedoubler. It specifies roles and crucial steps for a secure and efficient incident management process. The following objectives should be adhered to:

- Secure Tradedoubler's operations.
- Minimizing impact on Tradedoubler.
- Traceability of steps and decisions taken during the process to enable improvements.

1.3 Summary

The workflow outlined for incident management process at Tradedoubler consist of five phases:

1. Discovery: The incident is discovered.

2. Assessment: The incident is assessed in terms of extent and effect on Tradedoubler.
3. Handling of incident: The incident is handled by the incident management team.
4. Termination of incident management process: The incident is resolved.

2 Discovery

2.1 Discovery of Production Environment Incident

2.1.1 An incident related to Tradedoubler's production environment is discovered when the PagerDuty system is generating an alert to the on-call team. The on-call team is available 24/7/365.

2.1.2 The on-call team performs a pre-assessment of the incident to assess whether the incident can be resolved directly, or if it needs to be escalated. The pre-assessment consider what systems are affected, how they are affected, and why they are affected. This result in an assessment of the severity level of the incident (minor, moderate, or major incident), and whether the incident needs to be escalated.

2.1.3 If the incident can be resolved directly, no escalation is needed, and the on-call team resolve the incident or forward it to a relevant role within Tradedoubler.

2.1.4 If the incident needs escalation, the on-call team notifies the incident manager, which can be either Head of Operations or Head of Engineering.

2.1.5 Incidents related to Oracle Cloud are the responsibility of by the 3rd party vendor Cegal and are primarily handled by Cegal consultants. Where there is an overlap in the affected service that can be handled by the Tradedoubler on-call team, Cegal notifies Tradedoubler as appropriate.

2.2 Discovery of Windows Infrastructure Incidents

2.2.1 An incident related to the Windows infrastructure is discovered when users create tickets in the Support Portal or when an automatic alert is received by one of the monitoring systems to the system administrator.

2.2.2 The support engineer at the Support Portal or the system administrator performs a pre-assessment of the incident to assess whether the incident can be resolved directly, or if it needs to be escalated. The pre-assessment consider what systems are affected, how they are affected, and why they are affected. This result in an assessment of the severity level of the incident (minor, moderate, or major incident), and whether the incident needs to be escalated.

2.2.3 If the incident can be resolved directly, no escalation is needed, and the support engineer or system administrator resolve the incident or forward it to a relevant role within Tradedoubler.

2.2.4 If the incident needs escalation, the support team notifies the Head of Corporate IT. Incidents related to Azure and Dynamics 365 are handled by Tradedoubler Corporate IT internal teams.

3 Assessment of the Incident and Initial Communication

3.1 The incident is assessed in terms of:

- Its extent,
- Affected products and services,
- What resources are needed to solve the problem,
- Who needs to be notified,
- Legal and regulatory requirements.

3.2 If the incident is assessed as a major incident with major effect on Tradedoubler's operations and business, the board is informed. For example, when there is a total loss of service. Escalation level 2 shall be used in these cases.

3.3 The Top Tech team is responsible for communication to customers when necessary, regarding the production environment.

3.4 The Corporate IT team is responsible for communication to all internal users when necessary, regarding the Windows infrastructure.

3.5 The assessed escalation level depends on the impact and urgency of the incident, as well as the time taken to resolve it. A minor incident may be escalated to level 2 if it is not resolved within 4 hours, while a major incident may be escalated to level 2 immediately.

Incident Type	Level 1	Level 2
Production Environment	On-call team member	Incident Manager (Head of Operations or CTO
Windows Infrastructure	Corporate IT	Incident Manager (Head of Corporate IT or Datacenter Hosting partner)

4 Handling of Incident

4.1 Incidents are prioritized over other current operations at Tradedoubler. Work to solve an incident shall be initiated within one hour from the discovery of the incident. Minor incidents not expecting to get worse are handled based on the nature of the incident. If it is not affecting a lot of users, the incident is handled outside of the incident management process.

4.2 For incidents related to the production environment, an organisation consisting of at least the Incident Manager and one member from the on-call team are set up to manage the incident. The on-call team are operating as an incident management team upon incidents.

4.3 For incidents related to Windows infrastructure, an organisation consisting of at least the Incident Manager and Corporate IT, are set up to manage the incident.

4.4 For incidents related to the production environment, the role as Incident Manager is generally taken by the Head of Operations, or, if unavailable, Head of Engineering. The Incident Manager is responsible for leading all work related to the incident.

4.5 For incidents related to Windows infrastructure, the role as Incident Manager is generally taken by the Head of Corporate IT. The Incident Manager is responsible for leading all work related to the incident.

4.6 The Incident Manager have the mandate to decide upon and execute appropriate actions to manage the incident, such as overtime, support and investments.

4.7 The Incident Manager is responsible for running records of actions and decisions and keep other documentation. These records should be kept in Microsoft Teams, and as a Jira ticket for incidents related to the production environment, and as Corporate IT tickets for incidents related to Windows infrastructure.

5 Termination of Incident Management Process

5.1 The incident is terminated by the Incident Manager when all problems have been solved, and no residual problems remains if it is a major incident. For minor or moderate incidents, the on-call team terminates the incident.

5.2 Upon termination of the incident, an incident report shall be written. The incident report shall outline the incident's background, and measures taken to handle the incident, including time stamps and responsible persons.

5.3 Incident reports of major severe incidents shall be sent to Tradedoubler's board.

5.4 The on-call team shall have a weekly meeting where incidents from the last week are discussed, including what caused the incident, how it was resolved, and how it can be avoided in the future.

6 Communication and Documentation

6.1 Communication

6.1 .1 Internal communication regarding the incident is sent out where an incident is major severity, or moderate severity which also affects customers. Minor incidents are typically not communicated internally outside the on-call team or Corporate IT team. Internal communication is sent out after resolution of a major incident and moderate incidents (where customers are affected).

Type of incident	Initial message	Updates	Final message
Major incident	As soon as discovered	Every hour	Upon termination
Moderate incident	If customers are affected, notifies internally	If customers are affected, as necessary	If customers are affected, upon termination
Minor incident	None	None	None

6.1.2 In case of major incident, affecting a major part of Tradedoubler's services and products, Tradedoubler's board shall be notified.

6.1.3 If the incident is classified as a personal data breach, the DPO shall be informed.

6.1.4 If personal data breach, the DPO must report the incident within 72 hours to the competent data protection authority within the country according to GDPR article 33. Data subjects shall be informed without undue delay according to GDPR article 34, if the personal data breach result in a high risk to rights and freedoms of natural persons.

6.2 Documentation

6.2.1 Records of activities and decisions taken during handling of an incident shall be written as a Jira ticket or as a Corporate IT ticket depending on the systems and applications affected.

6.2.2 The incident reports shall be documented and saved.

6.2.3 If a customer asks for an incident report, a customized version is sent to the customer.
